ECONOMICAL AND
ENVIRONMENTAL
IMPACT"**

WATER- SOIL : ECONOMICAL AND ENVIRONMENTAL IMPACT

OBJECTIVES

Rocks and soils constitute the framework of the landscapes and environments in which people live. The mountainous environments, the great plains, the valleys or the coasts that support cities, agriculture, transport axes... are the result of the long geological history of the planet, of the nature of the rocks, of the climatic changes that justify the variety of shapes (types of slopes, valleys, coastal forms) and the nature of the surface formations (scree, rolled deposits, loess...). The soils, thin cover, from a few centimeters to a few meters, which cannot be confused with the rocks that are the substrate, are also the result of a complex history. This fragile film is fundamental to understanding the specificities of plant formations and agriculture. Anthropization has caused and is still responsible for modifications: pollution, degradation, destruction of soils. The geological dynamics of the earth participates in the great planetary flows (carbon cycle) and partly explains the modifications (CO₂ discharges of volcanic origin...).

The day deals with these multiple problems related to soil and subsoil in order to study the parameters and the economic-environmental impact of these phenomena.
